

Designers Guide

Creating a cut line

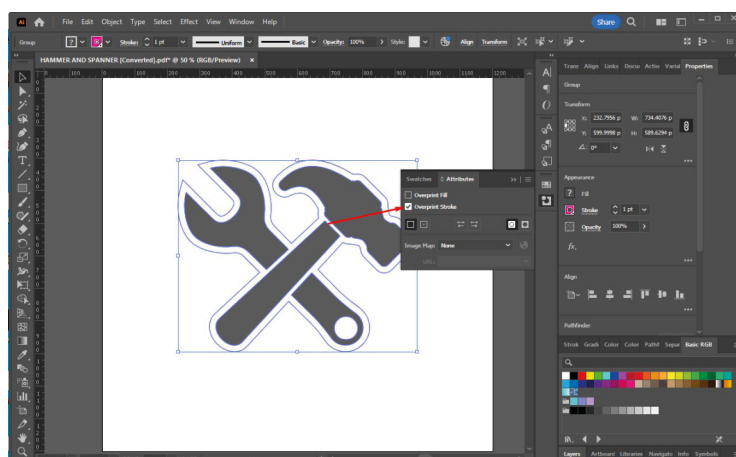

1. Create the cut line as a vector line. Select it click New Swatch.

2. Enter the name as CutContour and set the Colour Type as Spot Colour. You can set any colour you like, but we suggest you use something that is easy to see against your design.

3. In the attributes panel, make sure Overprint Stroke is ticked. This ensures that the colours below the cut line are printed, rather than leaving a white area.

4. Save your design as a PDF using the Press Quality preset.

Most items are available in various colours. Prices exclude VAT and design work (where required).
